Login form with password visibility toggle

Create a login form that includes fields for username and password. Implement a feature that allows users to toggle the visibility of the password field between plain text and obscured text (e.g., using an eye icon).

To create a login form in Android that includes fields for a username and password, along with a feature to toggle the visibility of the password field, you can follow these steps. This implementation will use an **EditText** for the username and password, and an **ImageView** to represent the eye icon for toggling password visibility.

Step 1: Layout XML

Create a layout file (e.g., **activity_login.xml**) with the following code:

xml

RunCopy code

```
1<LinearLayout
2    xmlns:android="http://schemas.android.com/apk/res/android"
3    android:layout_width="match_parent"
4    android:layout_height="match_parent"
5    android:orientation="vertical"
6    android:padding="16dp">
7
8    <TextView
9        android:layout_width="wrap_content"
10       android:layout_height="wrap_content"
11       android:text="Login"
12       android:textSize="24sp"
13       android:layout_gravity="center"
14       android:paddingBottom="16dp"/>
15
```

```
16  <EditText
17      android:id="@+id/editTextUsername"
18      android:layout_width="match_parent"
19      android:layout_height="wrap_content"
20      android:hint="Username" />
21
22  <LinearLayout
23      android:layout_width="match_parent"
24      android:layout_height="wrap_content"
25      android:orientation="horizontal"
26      android:layout_marginTop="8dp">
27
28      <EditText
29          android:id="@+id/editTextPassword"
30          android:layout_width="0dp"
31          android:layout_height="wrap_content"
32          android:hint="Password"
33          android:inputType="textPassword"
34          android:layout_weight="1" />
35
36      <ImageView
37          android:id="@+id/imageViewTogglePassword"
38          android:layout_width="wrap_content"
39          android:layout_height="wrap_content"
40          android:src="@drawable/ic_visibility_off"  <!-- Use your own icon -->
41          android:contentDescription="Toggle Password Visibility"
42          android:paddingStart="8dp"
43          android:paddingEnd="8dp"
```

```
44          android:layout_gravity="center_vertical" />
45    </LinearLayout>
46
47    <Button
48        android:id="@+id/buttonLogin"
49        android:layout_width="match_parent"
50        android:layout_height="wrap_content"
51        android:text="Login"
52        android:layout_marginTop="16dp" />
53
54</LinearLayout>
```

Step 2: Activity Code

In your activity (e.g., **LoginActivity.java**), implement the following code:

java

RunCopy code

```
1import android.os.Bundle;
2import android.view.View;
3import android.widget.Button;
4import android.widget.EditText;
5import android.widget.ImageView;
6import android.widget.Toast;
7import androidx.appcompat.app.AppCompatActivity;
8
9public class LoginActivity extends AppCompatActivity {
10
11    private EditText editTextUsername, editTextPassword;
12    private ImageView imageViewTogglePassword;
13    private boolean isPasswordVisible = false;
```

```
14
15  @Override
16  protected void onCreate(Bundle savedInstanceState) {
17      super.onCreate(savedInstanceState);
18      setContentView(R.layout.activity_login);
19
20      editTextUsername = findViewById(R.id.editTextUsername);
21      editTextPassword = findViewById(R.id.editTextPassword);
22      imageViewTogglePassword = findViewById(R.id.imageViewTogglePassword);
23      Button buttonLogin = findViewById(R.id.buttonLogin);
24
25      imageViewTogglePassword.setOnClickListener(new View.OnClickListener() {
26          @Override
27          public void onClick(View v) {
28              togglePasswordVisibility();
29          }
30      });
31
32      buttonLogin.setOnClickListener(new View.OnClickListener() {
33          @Override
34          public void onClick(View v) {
35              // Handle login logic here
36              String username = editTextUsername.getText().toString().trim();
37              String password = editTextPassword.getText().toString().trim();
38
39              if (!username.isEmpty() && !password.isEmpty()) {
40                  // Simulate successful login
```

```
41                 Toast.makeText(LoginActivity.this, "Login Successful",
Toast.LENGTH_SHORT).show();
42             } else {
43                 Toast.makeText(LoginActivity.this, "Please enter both username and
password", Toast.LENGTH_SHORT).show();
44             }
45         }
46     });
47 }
48
49 private void togglePasswordVisibility() {
50     if (isPasswordVisible) {
51         // Hide password
52         editTextPassword.setInputType(android.text.InputType.TYPE_CLASS_TEXT |
android.text.InputType.TYPE_TEXT_VARIATION_PASSWORD);
53         imageViewTogglePassword.setImageResource(R.drawable.ic_visibility_off); //
Change to your "eye off" icon
54     } else {
55         // Show password
56         editTextPassword.setInputType(android.text.InputType.TYPE_CLASS_TEXT |
android.text.InputType.TYPE_TEXT_VARIATION_VISIBLE_PASSWORD);
57         imageViewTogglePassword.setImageResource(R.drawable.ic_visibility); // Change
to your "eye on" icon
58     }
59     isPasswordVisible = !isPasswordVisible;
60     // Move the cursor to the end of the password field
61     editText
```
